Reconstruction and Development (EBRD)**

Technology Guide Development for Sound
POPs Management in the Mediterranean
Region (Balkans, SEMED and Türkiye)

January 2023

European Bank
for Reconstruction and Development

This report has been prepared for the EBRD.

This publication has been produced with the assistance of the EBRD. The contents of this publication are the sole responsibility of Earth Active Ltd. and do not necessarily reflect the views of the EBRD.

This study is funded by the EBRD "*Child Project 1.3: Financing Advanced Environmental Technologies in the Mediterranean Sea Region for Water Systems and Clean Coasts (GEF ID. 9691)*" under the Global Environment Facility (GEF) funded "*Mediterranean Sea Programme (MedProgramme): Enhancing Environmental Security (GEF ID. 9607)*".

Disclaimer

This document entitled **Technology Guide Development for sound POPs management in the Mediterranean region** was prepared by Earth Active Ltd ("EA") for the account of the **EBRD** (the "Client") with all reasonable skill, care and diligence within the terms of the Appointment and with the resources and manpower agreed with the Client. Unless EA has expressly agreed otherwise, this document must not be used, or relied upon, by any third party and EA disclaims all liability for any such use or reliance. This document should be used only in its complete form, including any disclaimers, without modification. This document is based on current conditions (such as environmental, regulatory or policy conditions) at the time it was prepared, and EA is not responsible for updating it to reflect subsequent changes in those conditions or advising the Client on their impact. This report has been prepared based on the information reasonably available during the project programme. All information relevant to the scope may not have been received. EA has not undertaken a complete verification of any data and information provided to it by the Client or any third party, is entitled to rely on those inputs, and is not responsible for the accuracy, correctness, completeness or fitness for purpose of those inputs or any outputs based on them. Unless expressly identified otherwise, EA has not consulted with funders or other interested third parties. Even if such consultation has taken place, EA cannot guarantee that the contents of this document will be accepted by funders or other interested third parties. EA is an environmental consultant, and this document does not constitute legal, financial or investment advice. The Client is recommended to seek further specialist advice where applicable and is responsible for its own investment decisions.

It should be noted that the inclusion of a particular technology in this report does not constitute a recommendation for that company or their technology, rather the purpose is to illustrate the options that exist for a POPs-free alternative for the specific use or context under consideration.

Executive Summary

Persistent Organic Pollutants (POPs) are the name given to a large number of organic chemical substances, which have been shown to have a significant impact on the environment and human health. Many POPs can be transported by wind and water, meaning that those generated in one country may affect people, animals, and plants far from where they are used and released. They persist for long periods of time in the environment and can accumulate and pass from one species to the next through the food chain. The characteristics of POPs, notably their long environmental lifetime and the fact that they can have impacts far from where they were produced, mean that countries need to work together for their elimination. The 2001 Stockholm Convention is a global treaty aiming to protect human health and the environment from the effects of POPs and focuses on eliminating or reducing their release.

The European Bank for Reconstruction and Development (EBRD) commissioned Earth Active to undertake research to identify and assess off-the-shelf technologies for the responsible management of four groups of POPs in eight countries across the Mediterranean region, namely Albania, Bosnia and Herzegovina, Egypt, Lebanon, Montenegro, Morocco, Tunisia, and Türkiye. The assignment supports the EBRD's Environmental Technology Transfer Programme (ENVITECC), funded by the Global Environment Facility under the Mediterranean Sea Programme: Enhancing Environmental Security (MedProgramme) (2020-2024) and is aligned with the bank's Green Economy Transition (GET) approach. Ultimately, it is intended that suitable technologies and POPs-free materials identified as part of this assignment will be made available in the EBRD's Green Technology Selector, which is a global shopping-style online platform launched by the EBRD in 2018 that connects vendors of the best green technologies with forward-thinking business and homeowners.

The assignment focuses on the following four groups of POPs:

- **PCBs** – Polychlorinated Biphenyls – used in a large number of industrial applications, in particular as dielectric (insulating) fluids in transformers and capacitors
- **PFAS / PFOS** – Per / poly fluoroalkyl substances – used in fire-fighting foams, electric and electronic equipment and as surface treatment agents
- **HBCD** – Hexabromocyclododecane – mainly used as a flame-retardant additive and thermal insulation in polystyrene materials in the building industry as well as in upholstered furniture and packaging materials
- **SCCP** – Short-chain chlorinated paraffins – used in metalworking and PVC processing and as a plasticizer and flame retardant in rubber, paints and adhesives.

The use of these POPs in the context of the following priority areas and sectors is considered to identify alternative technologies and POP-s free materials:

- Exposure to POPs at homes and offices
- POPs release to the environment due to industrial / commercial scale production and use of POPs containing firefighting foams
- Intentional industrial uses of POPs in the manufacturing industry
- Unintentional release of POPs to the environment from industrial processes.

Currently, identification of alternatives to POPs-containing products can be difficult, due to *inter alia* a general lack of awareness about POPs, the large number of different chemicals, their wide range of uses, the difficulty in obtaining information on the composition of many products, and the fact that many alternatives are also POPs or have POPs-like characteristics.

Relevant data for each country were obtained from the latest National Implementation Plans (NIPs) prepared under the Stockholm Convention, and a range of secondary sources supported by a network of in-country technical experts.

In conducting the research, a number of challenges were encountered due to inconsistencies in reporting and methodologies used to quantify POPs production and consumption and a lack of available data. Notably, not all eight countries have published updated NIPs since the initial Conference of the

Parties (COP) in 2001. Since then, 19 new POPs have been added to the Convention, three of which (PFOS, HBCD and SCCP) are a specific focus of this report.

The research found that, as would be expected, there were fewer available alternatives and technologies for the POPs which were most recently added to the Convention. For example, for SCCPs, the majority of identified alternatives are also considered to have POPs-like characteristics and indeed are under consideration for addition to the Stockholm Convention. In terms of disposal of all four groups, whilst various remediation and disposal technologies have been developed, these are typically small scale and high-temperature incineration remains the preferred solution.

Inclusion of a technology or product on the EBRD's Green Technology Selector (GTS) platform requires that defined minimum performance criteria are met. For POPs technologies identifying criteria that are both clear in terms of relevance to POPs and also to the ENVITECC countries was a key aim. It is also essential to recognise that a number of technologies and products (currently) using POPs also need to meet additional criteria and specifications relating to safety and efficacy.

It is hoped that the identification of suitable alternative products and technologies and provision of clear, accessible information on POPs via the GTS platform will therefore contribute to the safe and responsible management of POPs-contaminated products in accordance with the Stockholm Convention and contribute to the wider body of knowledge on POPs and their alternatives.

UNIDO	United Nations Industrial Development Organisation

1. Introduction

The European Bank for Reconstruction and Development (EBRD) has appointed Earth Active Ltd. (EA) to identify and assess off-the-shelf technologies for the responsible management of Persistent Organic Pollutants (POPs) in the Mediterranean region.

This assignment supports EBRD's Environmental Technology Transfer Programme (Financing Advanced Environmental Technologies in the Mediterranean Sea Region for Water Systems and Clean Coasts (ENVITECC)), funded by the Global Environment Facility under the Mediterranean Sea Programme: Enhancing Environmental Security (MedProgramme) (2020-2024)¹, which focuses on the depollution of the Mediterranean Sea, and the removal of POPs from the region. ENVITECC is aligned with the bank's Green Economy Transition (GET)² approach, to promote investments, which encourage the sustainable use of resources and protection of natural assets through the introduction of new technologies, equipment and practices into target markets.

POPs include a variety of organic chemical substances, shown to have a significant impact on the environment and human health. Many POPs can be transported by wind and water, meaning that those generated in one country may affect people, animals, and plants far from where they are used and released. They persist for long periods of time in the environment and can accumulate and pass from one species to the next through the food chain. The characteristics of POPs, notably their long environmental lifetime and the fact that they can have impacts far from where they were produced, means that countries need to work together for their elimination. The Stockholm Convention is a global treaty that aims to protect human health and the environment from the effects of persistent organic pollutants and focuses on eliminating or reducing releases of POPs³.

2. Background

2.1 The EBRD's ENVITECC Programme

The EBRD's ENVITECC Programme is working to promote investment in wastewater treatment and recycling and reduce or eliminate POPs in eight target countries, namely Albania, Bosnia and Herzegovina, Egypt, Lebanon, Montenegro, Morocco, Tunisia, and Türkiye.

The ENVITECC programme forms part of a global effort to protect citizens and the environment from POPs, in accordance with a number of international conventions as summarised below.

¹ <https://www.unep.org/unepmap/what-we-do/projects/MedProgramme>

² <https://www.ebrd.com/what-we-do/get.html>

³ <http://chm.pops.int/TheConvention/Overview/tabid/3351/Default.aspx>

Stockholm Convention on Persistent Organic Pollutants (2001)

Signed on 22nd May 2001 and coming into force on 17th May 2004, the Stockholm Convention, to eliminate or reduce the release of POPs into the environment, has been ratified by over 152 countries. The Stockholm Convention builds on the Aarhus Protocol, recognising a further six substances (Annex 1). The Stockholm Convention can be understood as having five key objectives (United Nations Industrial Development Organisation, 2022):

- Eliminate POPs
- Support the transition to safer alternatives
- Target additional POPs for action
- Clean-up old stockpiles and equipment containing POPs
- Work together for a POPs-free future

Since its creation, there have been nine meetings of the Conference of the Parties, during which time 19 new compounds have been added to the initial 12 listed under the Convention.

On 11th March 2022, Member States agreed to further restrict the presence of POPs in waste; these recent amendments largely cover limit values for dioxins and furans, which are present as impurities in some ashes.

All ENVITECC countries have ratified this convention and adopted it in their national legal frameworks

Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal (1989)

The Basel Convention was signed in 1989 and came into effect in 1992. Its overarching objective is to protect the health of humans and the environment from the adverse effects of hazardous waste, centring around the following principal aims:

- the reduction of hazardous waste generation and the promotion of environmentally sound management of hazardous wastes, wherever the place of disposal;
- the restriction of transboundary movements of hazardous wastes except where it is perceived to be in accordance with the principles of environmentally sound management; and
- a regulatory system applying to cases where transboundary movements are permissible.

All ENVITECC countries have ratified this convention and adopted it in their national legal frameworks.

The Rotterdam Convention on the Prior Informed Consent Procedure for Certain Hazardous Chemicals and Pesticides in International Trade (1998)

The Rotterdam Convention came into force in 2004. Its purpose is to promote informed decision making and open information exchange over the trade, labelling and handling of hazardous chemicals and the following two primary objectives:

- to promote shared responsibility and cooperative efforts among Parties in the international trade of certain hazardous chemicals in order to protect human health and the environment from potential harm;
- to contribute to the environmentally sound use of those hazardous chemicals, by facilitating information exchange about their characteristics, by providing for a national decision-making process on their import and export and by disseminating these decisions to Parties.

All ENVITECC countries except Egypt have ratified this convention and adopted it in their national legal frameworks.

Aarhus Protocol on Persistent Organic Pollutants (1998)

The Protocol on Persistent Organic Pollutants (POPs) is an addition to the Geneva Convention on Long-Range Transboundary Air Pollution (1979) and was adopted in 1998, with the objective to 'control, reduce or eliminate discharge, emissions and losses' of POPs in Europe. As of 2013, the protocol has been ratified by 31 states and the European Union. 16 substances were originally included, and seven more have been recognised since the last amendments were made in 2009.

Montenegro is the only ENVITECC country that has ratified this Protocol.

2.2 Focus of this assignment

This assignment builds on a feasibility study carried out in 2017 for the EBRD during the Project Preparation Phase of ENVITECC, which identified activities and technologies that eliminate or significantly reduce the production and/or consumption of POPs in six countries in the Mediterranean Region (all ENVITECC countries with the exception of Lebanon and Türkiye).

The assignment focuses on PCBs, one of the original 12 listed POPs, and three new POPs, namely PFAS/PFOS, HBCD and SCCP (Annex 2), in the context of the following priority use areas and sectors:

- (1) Exposure to POPs at homes and offices;
- (2) POPs release to the environment due to industrial / commercial scale production and use of POPs containing fire-fighting foams;
- (3) Intentional industrial uses of POPs in the manufacturing industry ;
- (4) Unintentional release of POPs to the environment from industrial processes.

The identification and implementation of innovative, resource efficient technologies and practices will improve the management of POPs-containing materials throughout their lifetime, to minimise risk of exposure to the natural environment.

Ultimately, it is intended that the technologies and POPs-free materials identified as part of this assignment will be made available in the EBRD's Green Technology Selector (GTS)⁴. GTS is a global shopping-style online platform launched by the EBRD in 2018 that connects vendors of the best green technologies with forward-thinking business and homeowners.

2.3 Overview of the approach to the assignment

The assignment comprises the following principal tasks:

2.3.1 Review of country-specific background information to identify baselines

Identification of production and consumption patterns for the four groups of POPs in each of the eight ENVITECC countries, considering the priority use areas and both intentional and unintentional production.

The findings of this task are presented in Section 0.

2.3.2 Identification of priority sectors for each country and each target POPs chemical

Taking each country in turn, the top sectors where implementation of commercially available POPs management measures (avoidance, treatment / remediation / safe disposal) would bring the maximum positive overall impact in terms of POPs elimination and reduction were identified.

The findings of this task are presented in Section 4.

⁴ Green Technology Selector home page

2.3.3 Technology guide development

Off-the-shelf technologies and practices used in the avoidance, treatment, and disposal of the target POPs were identified. Where alternatives to POPs exist, further detail regarding environmental impacts, application constraints and financial costs are given.

The findings of this task are presented in Section 5.

2.3.4 Support to the development of the EBRD's Green Technology Selector

The Green Technology Sector promotes a broad range of green technologies, which are demonstrably best in class in that they exceed specified minimum performance criteria and standards e.g. in relation to energy efficiency, water use etc. POPs-free technologies are a completely new class of product for the GTS and minimum performance criteria were identified to enable onboarding of potential products and technologies.

2.4 Wider implications of this assignment

Currently, identification of alternatives to POPs-containing products can be difficult, due to *inter alia* a general lack of awareness about POPs, the large number of different chemicals and the complexity of their nomenclature, their wide range of uses, the difficulty in obtaining information on the composition of many products, and the fact that many alternatives are also POPs or have POPs-like characteristics.

Identification of suitable alternative technologies and provision of clear, accessible information on POPs will therefore contribute to the safe and responsible management of POPs-contaminated products in accordance with the Stockholm Convention.

Although this assignment focuses on the eight ENVITECC countries, the essentially global nature of chemicals manufacturing and thus production of POPs and POPs-free products and their use, means that the findings will contribute to the wider body of knowledge on POPs and their alternatives.

A note on nomenclature:

Per- and polyfluoroalkyl substances (PFASs) are chemicals that have partially or completely fluorinated carbon chains of varied lengths. These substances are used in almost all industry branches and many consumer products. The most-studied PFASs are perfluorooctane sulfonic acid (PFOS), perfluorooctanoic acid (PFOA), and perfluorohexane sulfonic acid (PFHxS).

At the time of compilation of this Report, the latest overview of PFASs as reported at the Stockholm Convention website⁵ are summarized below:

PFOS, its salts and PFOSF: In 2009, the Conference of the Parties (COP) listed PFOS, its salts and perfluorooctane sulfonyl fluoride (PFOSF) in Annex B to the Stockholm Convention (decision SC-4/17).

In 2019, following the evaluation of the continued need for PFOS, its salts and PFOSF, the COP amended Annex B to remove several of the specific exemptions and acceptable purposes for PFOS, its salts and PFOSF (decision SC-9/4).

PFOA, its salts and PFOA-related compounds: In 2019, the COP listed PFOA, its salts and PFOA-related compounds in Annex A to the Stockholm Convention (decision SC-9/12).

The updated indicative list of substances covered by the listing of PFOA, its salts and PFOA-related compounds is published by the Convention Secretariat (UNEP/POPS/POPRC.17/INF/14/Rev.1).

Part X of Annex A (paragraph 2 d) requires that the use of fire-fighting foam that contains or may contain PFOA, its salts and PFOA-related compounds to be restricted to sites where all releases can be contained by the end of 2022 if the party has the capacity to do so, or by 2025 at the latest.

PFHxS, its salts and PFHxS-related compounds: In 2022, the Conference of the Parties listed PFHxS, its salts and PFHxS-related compounds in Annex A to the Stockholm Convention (decision SC-10/13).

Initial indicative list of PFHxS, its salts and PFHxS-related compounds is published by the Convention Secretariat (UNEP/POPS/POPRC.15/INF/9).

Long-chain perfluorocarboxylic acids (LC-PFCAs), their salts and related compounds: The POPs Review Committee is currently reviewing LC-PFCAs, their salts and related compounds, proposed for listing in Annexes A, B and/or C to the Stockholm Convention.

It is important to note that, at the time of compilation of this Report, PFOS and PFOA are the only PFAS chemicals that are listed in the Stockholm Convention. The full name for PFOS is perfluorooctane sulfonic acid (PFOS), its salts and perfluorooctane sulfonyl fluoride (PFOSF)

This report therefore refers to PFOS rather than 'PFAS/PFOS' when considering the country-specific baselines, which are derived from the information produced under the Stockholm Convention.

PFAS are discussed in Section 6 given their ubiquity and significance.

⁵ Industrial POPs: PFAS Overview. Stockholm Convention

3. Country-specific background information

3.1 Introduction

Relevant data for each country were obtained from the latest National Implementation Plans (NIPs) prepared under the Stockholm Convention (2001), as well as secondary sources such as Country Situation Reports published by the International Pollutants Elimination Network (IPEN)⁶, and peer-reviewed scientific papers and reports published by organisations such as the Organisation for Economic Co-operation and Development (OECD). Where significant data gaps remained, Earth Active engaged a network of in-country technical experts to address these gaps as far as possible, for example by direct contact with relevant authorities in country.

Production and consumption patterns were identified, as defined by the General Guidance on POPs Inventory Development (Secretariat of the Stockholm Convention, 2020):

Production: of the POP or chemical preparations containing it (e.g. PFOS and formulations containing PFOS such as fire-fighting foams).

Net consumption of POP in [country]: [manufacture + import – export] of POP containing products or articles x POP content

Since most of the ENVITECC countries do not produce the target POPs themselves, but only import them (e.g. PFOS and HBCD, which are at this stage only produced in a limited number of countries), 'consumption' values therefore in most cases represent a country-wide inventory.

3.2 Methodological challenges

In conducting the research, some methodological challenges were encountered due to inconsistencies in reporting and a lack of available data. Not all ENVITECC countries have published updated NIPs since the initial Conference of the Parties (COP) in 2001. Since then, 19 new POPs have been added to the Convention, three of which (PFOS, HBCD and SCCP) are a specific focus of this report.

These inconsistencies have meant that where data are reported by one country, the equivalent data may not be available for other ENVITECC countries (because their NIP pre-dates the addition of some of the new POPs to the SC), so a variety of complementary sources have been utilised. A second issue is the accuracy with which countries quantify their POPs production and consumption patterns; given that the NIPs rely on self-reporting, the potential for under-reporting is relatively high, given that respondents may fear enforcement action based on the information they provide.

Conversely, quantification at a national level, which can be reliant on customs codes, may result in overestimation of consumption patterns dependent on the range of goods and materials covered by the code under consideration. Some NIPs therefore presented consumption figures as preliminary data, whilst more comprehensive surveys and inventory studies were included in the NIP action plans.

⁶ IPEN is a global network of public interest NGOs working to support the elimination of hazardous chemicals through stronger management and legislation

3.3 Findings

3.3.1 Introduction

A summary of country-specific key findings for each of the four POPs is provided below; a comprehensive table is included in Table 1. Given the wide disparity in reporting methods, quality and timing, it is challenging to present figures that allow for direct comparison. However, key common threads that emerged include:

- All countries report progress in eliminating PCBs, although quantitative data of progress (eradicated equipment vs. remaining stockpiles) at national level are difficult to obtain.
- Unintentional releases of PCBs are frequently not quantified, though some NIP reports contain useful information on the most significant hotspots.
- Priority sector uses are typically consistent between countries, e.g. HBCD is mostly used in polystyrene, whilst PFOS' most significant use is in textiles.
- None of the eight target countries is included on the register of specific exemptions⁷ or acceptable purposes⁸ for any of the four groups of chemicals. Details on exemptions on certain uses (not country-specific) have been provided in Annex 2⁹.

3.3.2 Albania

Albania published an updated NIP in 2017, addressing COP7 amendments, which covers all selected POPs with the exception of SCCPs. As a potential candidate to the European Union, the Albanian national legal framework is largely harmonised with EU legislation: the country has transposed EU regulation 850/2004 on POPs¹⁰ since 2015. The Albanian inventory is derived from amounts imported under specific customs codes. This has led to inaccuracies as one code can cover several classes of good. Moreover, some methodological errors have been noted as well. For example, the PFOS amount related to fire foams was calculated on the basis that it contains 500 – 1500 mg/kg article; however, the UNEP guidance 2012 states the content is between 5000 and 15000, a factor 10x higher.

PCBs: PCBs have never been produced in Albania, however, oil containing PCBs was imported for use in transformers and PCBs continue to be used in Albania's energy sector, as oils in heat exchangers, transformers, capacitors. Albania's NIP does not report unintentional production of PCBs; however, they may be inadvertently produced during hazardous waste incineration processes. Scientific studies indicate pollution is prevalent; various water bodies in Albania have PCB levels of up to 36.57 µg/L.

PFOS: Although Albania does not produce PFOS or its salts, they are widely used in a number of sectors *inter alia* packaging, textiles including leather products, synthetic carpets, and hydraulic fluids. The average amount of PFOS exposed is 7,208 kg/year, with the main sources of emissions into the environment being kitchen paper, plasticised cartons, packages and letters, leather products and hydraulic fluids. Synthetic carpets, textiles and tapestry and leather use also contribute to PFOS usage.

⁷ Specific Exemptions. Stockholm Convention

⁸ Acceptable purposes. Stockholm Convention

⁹ Türkiye previously had an exemption for production and use of HBCD, which expired on 26.11.2019, and a registration of an acceptable purpose for PFOS with respect to photo-imaging, which expired on 12.05.2015

¹⁰ Regulation (EC) No 850/2004 of the European Parliament and of the Council of 29 April 2004 on persistent organic pollutants and amending Directive 79/117/EEC.

HBCD: HBCDs are not produced in Albania, however they are used widely in the textiles sectors (76,940 kg) and construction sectors (11,990 kg). These are approximate inventory figures of material in country, the NIP does not provide details of the methodology used to arrive at these estimates (e.g. over which time span). Our in-country expert confirmed that no further detail was available. According to the 2017 NIP, the main application of HBCD is polystyrene foam, which contain 0.7 – 3% HBCD. Textile coverings also contain HBCD at concentrations of 2.2 – 4.3%.

SCCPs: Albania does not produce SCCPs, though they are still imported. Albania proposed control measures on 29 April 2015 to prohibit the production, placing on the market, and use of SCCPs, however as of 2016, SCCPs remain in use in the country. The amount imported cannot be fully quantified as the related custom code covers several goods, and custom documentation is not complete. It is understood that the Ministry of Environment is currently reviewing the use of SCCPs and the relevant legal framework in order to eliminate them in accordance with EU regulations.

3.3.3 Bosnia and Herzegovina

Bosnia and Herzegovina's (BiH) latest NIP was published in 2015, addressing COP 4 amendments, and therefore does not contain any information on HBCD or SCCP. It particularly highlights the challenge of limited statistical data (e.g. on waste management, site remediation and the import of POPs), due to limited laws and monitoring regulations, as well as lacking knowledge of responsible personnel completing the survey questionnaires.

At the time of writing, the Inventory Report of Persistent Organic Pollutants (POPs)¹¹ project implementation by UNDP is under way, with the goal of performing sampling at the sites and mapping locations contaminated by POPs in BiH. The site sampling phase is now complete, but the results have yet to be published. Sites include major industrial and agricultural sites, airports, landfills, etc., and depending on the site, sampling has been undertaken for PCBs, PCCD/F, HBB, PBDE, pesticides and PFOS.

PCBs: PCBs have never been produced in BiH and were usually imported from Serbia or Slovenia, however PCB-containing equipment is still in use, including transformers, capacitors and switches. With regards to unintentional production, the NIP identifies three hotspots that are contaminated with PCBs (where leakage and hence unintentional production occurs). The sites comprise an electricity distribution site (Zenica in the municipality of Jelah), as well as two coalmines in the municipalities of Durdevik and Breza. For the period from 1992 to the present day, there is no comprehensive information on import of equipment containing PCBs. This is because customs of Bosnia and Herzegovina have no specific tariff code for transformers / capacitors containing PCBs. Consumption is negative as waste containing PCBs is being exported; a total of nearly 3,000 tonnes of PCBs was exported between 2003 to 2013, and another 111 tonnes in 2015 as part of the Med Partnership Project.

PFOS: BiH has never manufactured PFOS or its salts, but does import and use products that contain them. Based on national statistics (import and export data as cited in the most recent NIP), the total PFOS consumption in 2012 was between 47.16 and 284.20 tonnes. The vast majority of this figure is associated with coating and coating additives (25.6 – 257 tonnes),

¹¹ UNDP (ongoing project). Environmentally Sound Management of Persistent Organic Pollutants (POPs) in Industrial and Hazardous Waste Sectors

followed by cleaning agents (waxes and polishes) and synthetic carpets. It was also used as a mist suppressor in the electroplating industry until 2015.

HBCD: Although HBCD was not covered in the NIP, according to the inventory developed under "*Environmentally Sound Management of Persistent Organic Pollutants (POPs) In Industrial and Hazardous Waste Sectors in BiH*", HBCD was most likely never produced in Bosnia and Herzegovina. The total estimated quantity (based on import and export data as cited in the most recent NIP) of HBCD present in buildings is 290-590 tonnes. No new EPS/XPS products containing HBCD are produced.

SCCPs: There are no data available on SCCPs in BiH. Currently there is consent to import under specific conditions (e.g. preparations containing SCCPs in concentrations lower than 1% by weight)¹².

3.3.4 Egypt

Egypt published an initial NIP in 2005, but has not provided any updates since. Therefore, there are no official data on PFOS, HBCD and SCCPs. However, through the Egyptian Environmental Affairs Agency (EEAA) it has implemented several projects related to the elimination of POPs (mostly focused on PCBs) in partnership with international partners such as JICA, UNEP, GEF, UNIDO, FAO, WHO and the World Bank.

The updated NIP is planned to be issued in 2022 and will include the new POPs, although at the time of writing (November 2022), it has yet to be published. It will likely be based on theoretical analysis rather than actual field inventories; a preliminary inventory was shared by the national expert, covering PBDEs, HBCD, PFOS and SCCP.

PCBs: Although not explicitly stated in the NIP and whilst conclusive data on global producers of PCBs are missing, it is unlikely Egypt had a significant history in PCB production. PCBs are still contained within closed appliances in the power sector (those manufactured between 1950 – 1978); a 2005 inventory identified 3,666 condensers containing PCBs and 26 transformers which contain a total of 20,490 kg of PCB contaminated oil. The use of PCBs and equipment using PCBs is to be completely stopped by 2025. Whilst there is no recent NIP to address progress on this target, Egypt undertook an initiative (MedPartnership Project, led by UNEP/MAP and funded by the GEF) to dispose of 200 tonnes of PCBs in 2016.

PFOS: There are currently limited data on PFOS in Egypt because the country has not yet published an updated NIP. A 2016 paper¹³ identifies food contact paper and dust as being contaminated with PFOS (0.29 ng/g in food contact paper and 4.09 ng/g in dust), although notes that levels in household dust are typically lower in Egypt than many other countries due to the fact that imported wall to wall carpeting is not typically used in Egyptian homes. Instead, locally manufactured carpets are typically used, which are not generally treated with PFOS.

HBCD: There are currently no data available on HBCD in Egypt, though it will likely be included in the new NIP. The preliminary inventory indicated it is less likely to have been used in the textiles sector after 2015. Information obtained by our national expert indicates that consumption in the transport textiles sector is estimated between 243 and 1,655 tonnes per year.

¹² Stockholm Convention, [u.d.]. Import Responses. Short-chain chlorinated paraffins.

¹³ Shoeb T, Hassan Y, Rauert C, Harner T. Poly- and perfluoroalkyl substances (PFASs) in indoor dust and food packaging materials in Egypt: Trends in developed and developing countries. *Chemosphere*. 2016.

SCCPs: SCCPs are not produced in Egypt, however they are used in the processing of polyvinylchloride (PVC) and in some textiles and lubricants. Detailed inventories of imported SCCPs are lacking, though data may be included in the new NIP.

3.3.5 Lebanon

Lebanon's most recent NIP was published in 2017, addressing COP7 amendments and therefore does not contain information on SCCPs. The NIP highlights a number of challenges that were experienced in the production and implementation of the previous NIP, which included a lack of sufficient resources, both financial and technical, and the need to enhance awareness and communication amongst stakeholders. Specific measures to address these challenges include strengthening the legal and institutional framework for POPs chemicals management in Lebanon and the establishment of a National Implementation Unit (NIU).

PCBs: PCBs were never produced in Lebanon, but PCBs were used widely prior to the 1990s; PCB-free oil has been used in transformers now for many years. There is no quantification of unintended production (leakage) of PCBs in Lebanon, however 7 hotspots are listed: 2 power plants, 4 substations and an EDL (Electricité du Liban) repair shop (all damaged by airstrikes). The latter is the most critical; 1,600 transformers are stored on site and the remediation and safe disposal of the damaged equipment, including potentially PCB contaminated oil, is clearly a priority.

PFOS: PFOS and its salts are not produced in Lebanon, and there is no national inventory of PFOS. Lebanon's IPEN report highlighted fire-fighting foams as a likely major source, and POPs-containing AFFF foams are imported into Lebanon for use at gas stations.

HBCD: HBCD is not produced in Lebanon. Data on HBCD usage are incomplete as a high proportion of contacted firms did not respond, although the NIP reports total imports of 3,300 tonnes EPS construction insulation foams over the period 2004 – 2014. Likely usage includes construction, insulation foams, textile, and paints.

SCCP: There are no data available on SCCPs in Lebanon.

3.3.6 Montenegro

Montenegro's most recent NIP was published in 2019, addressing COP 5 amendments. As a potential candidate to the European Union, the Montenegrin national legal framework is largely harmonised with EU legislation: on December 7, 2022, existing legislation was revised to further align with EU POPs regulations¹⁴.

PCBs: PCBs have never been produced in Montenegro, however PCB-containing oil has been imported for use in transformers and capacitors. The most recent NIP includes planned measures which aim to fully identify and eliminate PCB-containing fluids in devices by 2025. Unintentional release of PCBs in Montenegro is mainly related to uncontrolled burning processes at open dumps. Release of PCBs reduced from 6.79 g/year in 2006 to 2.57 g/year in 2016. Leakage was not considered as potential source of unintentional release of PCBs.

¹⁴ Official Gazette of Montenegro Number 134/2022, 1865

PFOS: PFOS and its salts are not produced in Montenegro, and no PFOS-containing fire-fighting foams have been used in the last ten years, according to the NIP. There are no industries in Montenegro that use PFOS.

HBCD: There are no registered producers of HBCD. The estimated total consumption of HBCD in Montenegro for the period 2006-2016 is 34,359 tonnes. The total estimated amount of HBCD in Montenegro (products that potentially contain it and from the construction waste), as of 2016, is 3,661 tonnes.

SCCPs: Import and usage of SCCP is prohibited¹⁵ since 2017.

3.3.7 Morocco

Morocco was one of the earliest signatories of the Stockholm Convention in 2001, with ratification in 2004. However, comprehensive legislation regarding POPs is not in place yet, but highlighted as priority actions in the latest NIP of 2019, addressing COP8 amendments (e.g. reporting and registration of PCB contaminated transformers, to reduce non-intentional production of POPs, as well as controlling POP concentrations in the environment).

PCBs: All transformers produced in Morocco are now PCB-free, however a total of 103 transformers with contamination above 5,000ppm have been identified, of which are 89 still in service. The total PCB content of this equipment is calculated to be 43,785 kg, whilst some 1,530 tonnes of PCB-containing equipment has been eliminated. Morocco's NIP does not include an assessment of unintentional release of PCBs.

PFOS: PFOS has never been produced in Morocco, however consumption is estimated at between 1,324.8 kg per year and 13,092.0 kg per year, largely attributed to paper, packaging, carpet, and leather coatings.

HBCD: HBCD has never been produced in Morocco, but HBCD is used in the construction and textile sectors, with total usage estimated at between 126,911 and 458,791 kg for 2013.

SCCPs: There are no data available on SCCPs in Morocco.

3.3.8 Tunisia

Tunisia was one of the earliest signatories of the Stockholm Convention in 2001, with ratification in 2004. Several decrees specifically covering PCBs and other POPs are being drafted (although are not yet in force). Tunisia published its most recent NIP in 2018, addressing COP4 amendments which therefore includes HBCD and PFOS, albeit as preliminary data (the NIP does call for developing detailed inventories for PFOS, HBCD (and PBDE)). SCCP was not included, nor was it part of the inventory plan.

PCBs: Tunisia has never produced PCBs. The NIP identifies some 1,212 tonnes of equipment and contaminated soil that have already been processed and a further 1,214 tonnes of equipment containing PCBs has been identified by the Agence Nationale de Gestion des Déchets (ANGED) to be withdrawn to address the SC's 2025 target.

¹⁵ SCCP are not included in the list of registered chemicals in Montenegro ("Official Gazette of Montenegro" no. 051/17 as of 03/08/2017)

PFOS: Tunisia does not produce PFOS but did import PFOS-containing products (including fire-fighting foams) from abroad until 2011. Estimated quantities of PFOS remaining in waste are between 18.4 and 160.87 tonnes.

HBCD: HBCD is not produced in Tunisia and is not imported as a pure substance but is imported as a component of mixtures and raw materials. The estimated quantities of HBCD sold annually on the Tunisian market is around 85 tonnes (in the form of polystyrene).

SCCPs: Data are not available on SCCPs in Tunisia.

3.3.9 Türkiye

Türkiye ratified the Stockholm Convention in 2009, and published its most recent NIP in 2022, to address the COP 9 amendments. In 2018, Türkiye published Gazette No. 305951 on the Regulation of Persistent Organic Pollutants, which has been drafted to align with the EU POPs Regulations (EC) No. 850/2004.

PCBs: PCBs have never been produced in Türkiye. A total of 1,080 tonnes of pure PCB-containing materials were identified in a 2013 inventory, of which 634 tonnes have already been eliminated. The 2022 NIP still cites the 2013 inventory as being the latest; there are no more recent figures for PCB elimination carried out since 2016. The NIP does cite some studies on ambient PCB levels in the air, generally demonstrating PCB levels are low in the atmosphere. Some hotspots with notable concentrations include Bursa (a city with 18 industrial zones), Izmir and Kocaeli.

PFOS: PFOS is not produced in Türkiye. Net consumption of PFOS (difference between the import and export amounts) quantities significantly decreased between 2017 – 2019, by 985 kg. The latest (2019) consumption figure is 40 kg/annum. Consumption of PFOS-related substances¹⁶ was negative in 2019: -11.83 tonnes. There are no data available on PFOS wastes in Türkiye.

HBCD: Türkiye's NIP does not give production figures for HBCD but assumes that production does not take place. However, there are 4 expanded and 7 extruded polystyrene producers in the building and construction sector in Türkiye and the industry is the largest in the Middle East and Central Asia region and the third largest in Europe. The annual HBCD consumption was therefore high (up to 1,214,167kg/annum), until its use was banned in 2020 through the By-law on Persistent Organic Pollutants. A stockpile of 23 tonnes was disposed of with the support of GEF.

SCCPs: An SCCP inventory for Türkiye identified SCCP to be present in the country, however no specific data on this chemical have been released, as legislation is new. Based on TURKSTAT data, the NIP estimates a 14.7 tonnes net consumption figure for 2019 (materials containing SCCP). However, this is likely an over-estimate and does not indicate the actual SCCP content. Import is allowed if concentration in substances lower than 1% by weight / or 0.15% in articles containing SCCPs. Import and export amounts have been included in NIP (around 16 tonnes residual amount per year), though it is indicated this is likely an overestimate and more detailed inventory is required

¹⁶ Defined as a substance containing one or more PFOS groups that can, or are assumed to be, degraded to PFOS in the environment. Restricted through the listing of PFOSF under the Stockholm Convention

Table 1: Country-specific Background Information

POPs Baseline	PCBs	PFOS ¹⁷	HBCD	SCCP
Albania	<p>None / no data on unintended production.</p> <p><u>NIP (2017):</u> PCBs were never produced in Albania. Transformer oil was always imported from other (European and Asian) countries.</p> <p>The NIP does not report on unintended production (e.g. hotspots where leakage may occur) of PCBs.</p> <p><u>Various studies on PCBs in Albania¹⁹</u> Scientific studies indicate pollution is prevalent, as various water bodies (e.g. Vjosa, Aoos and Devola rivers) have PCB concentrations of up to 36.57 µg/L. The origin of PCBs in river ecosystems is mainly because of atmospheric deposition.</p>	<p>None.</p> <p><u>NIP (2017):</u> Perfluorooctane sulfonic acid (PFOS), its salts, Perfluorooctanesulfonyl fluoride (PFOSF) are not produced in Albania.</p>	<p>None.</p> <p><u>NIP (2017):</u> Hexabromocyclododecane (HBCD) is not produced in Albania, but is contained in goods and equipment which are currently used.</p>	<p>None.</p> <p><u>POPs Review Committee Twelfth meeting 01/06/2016²⁰:</u> Albania proposed control measures on 29 April 2015 to prohibit the production, placing on the market and use of SCCPs. The National Environmental Agency will maintain a database and report every four years on the progress made to eliminate SCCPs</p> <p><u>SC/ Request for information specified in Annex E for SCCPs</u> Based on the information from National Environment Agency, there are no activities licensed to produce this substance.</p>
	<p>8,680 tonnes of PCB oil in transformers present</p> <p><u>NIP (2017):</u> Comprehensive data are lacking. A full study remains to be undertaken (part of Albania's 2017 Action Plan) to analyse the presence of PCBs, not only in transformer oils, but also in soil, sediments, water and organisms.</p> <p>The total number of transformers used in the energy sector is about 12,789, while the total quantity of transformer oil is about 8,679,542 litres. During the first inventory on PCBs carried out in 2005, it emerged that 5.3% of the inspected</p>	<p>Consumption between 1.86 – 12.55 tonnes/year (note: likely much higher as NIP calculation is identified to contain errors)</p> <p><u>NIP (2017):</u> PFOS are contained in goods and equipment which are currently being used in Albania.</p> <p>According to the NIP, the estimated annual PFOS (and its related substances) consumption (in kg/year) varies from 1863.75 kg/year to 12,552.5kg/year (*), or the average amount of PFOS exposed is 7,208 kg/year.</p>	<p>2017 NIP inventory: 88.93 tonnes (construction + textile sector)</p> <p><u>NIP (2017):</u> People are widely exposed to HBCD; with the majority of the pollution coming from textiles used in household furniture.</p> <p>Extended and extrusion polymers have been the main users of HBCDs at national market.</p> <p>Total 2017 NIP inventory:</p>	<p>No specific data / import still allowed, though Ministry in process of reviewing exemptions.</p> <p><u>POPs Review Committee Twelfth meeting 01/06/2016</u> SCCPs are still imported by Albania.</p> <p>Albania consents to import subject to specified conditions²¹: SCCP, are included in part B, of Annex I, with some specific exemptions, which allows the placing on the market and</p>

¹⁷ The Guidance for Developing a National Implementation Plan for the Stockholm Convention on Persistent Organic Pollutants (January 2017) requires reporting on PFOS, its salts and PFOSF and PFOS related chemicals. Assessment of PFAS is not included in the guidance, hence reporting is limited. The data provided in this column therefore refers to PFOS unless explicitly stated otherwise.

¹⁸ The Stockholm Convention lists the 5 POPs as applicable to Article 5 (Measure to reduce or eliminate releases from unintentional POPs), which includes PCBs. Unintentional production of PCB, according to the Toolkit for Identification and Quantification of Releases of Dioxins, Furans and Other Unintentional POPs under Article 5 of the Stockholm Convention, is mainly described as PCB leakage. Details on PCB leakage hotspots have therefore been included as unintended POP production. The other POPs are not included in Article 5.

¹⁹ "A preliminary study of persistent organic pollutants in waters of Vjosa river, Albania", Elda Marku, Aurel Nuro, 17th International conference on chemistry and the environment 16-20 June 2019, Thessaloniki, Greece" and "Impact of floods on concentration of organic pollutants in Aoos River, Albania", 2020, Armela Tafa, International Journal on Environmental Analytical Chemistry"

²⁰ Stockholm Convention, 2016. Draft risk management evaluation: short-chain chlorinated paraffins UNEP/POPs/POPRC.12/11/Add.3

²¹ Stockholm Convention, [u.d.]. Import Responses. Short-chain chlorinated paraffins.

		<p>amount of oil was contaminated with PCBs, mainly found in small transformers.</p> <p>About 47% of the total number of transformers are manufactured before 1990 (about 6,000 units), and may therefore contain PCBs.</p>	<p>The main source of pollution is the use of kitchen paper, packaging and various cardboards, followed by synthetic carpets, textiles and tapestry, and leather use. Goods with lower potential include adhesives and varnish, hydraulic fluids (oils) used in aviation and fire-fighting foams.</p> <p>Fire foam is only a small contributor, with an estimated consumption of 5-10kg of PFOS per year.</p> <p>(*) It is noted that the NIP had significant methodological errors. For example, the PFOS amount related to Fire Foams was calculated on the basis that it contains 500-1500mg/kg article; however, the UNEP guidance 2012 states the content is between 5000 and 15000, a factor 10x higher.</p>	<p>Data below are annual but specific year not reported in NIP.</p> <p>Construction sector: 11,990 kg (mainly in ceiling insulation, as well as internal and external wall insulation).</p> <p>Textile sector: 76,940 kg (mainly in household furniture, vehicle upholstery and mattresses).</p>	<p>use of substances or mixtures which have SCCP in their content in a concentration less than 1% of weight.</p> <p><u>SC/ Request for information specified in Annex E for SCCPs</u></p> <p>Based on the information from General Directory of Customs, custom code nr. 3824 9097 there are several imports in Republic of Albania.</p> <p>But this custom code includes several goods, which only partly can correspond to the SCCPs CAS no 85535-84-8. Also keeping in mind that there is not a complete documentation of customs practices, a concrete, right information cannot be given. Based on the information from customs, a good part of these imports are made from subjects operating in the field of hydrocarbons.</p> <p>Currently the Ministry reviews the exemptions in order to completely eliminate SCCPs from being used. In addition, the legal basis that regulates this matter is being reviewed, in accordance with the EU's regulations as well.</p>
--	--	---	---	--	--

POPs Baseline		PCBs	PFOS	HBCD	SCCP
Bosnia and Herzegovina	Production	<p>None / no quantification of unintended production (leakage) of PCBs.</p> <p><u>NIP (2015):</u> PCB mixtures were never manufactured in Bosnia and Herzegovina, nor was there any production of equipment containing PCBs.</p> <p>The NIP identifies three hotspots that are contaminated with PCBs (where leakage and hence unintentional production occurs). The sites comprise an electricity distribution site (Zenica in the municipality of Jelah), as well as two coalmines in the municipalities of Durdevik and Breza. Qualitative analysis of samples from Zenica and Breza found presence of PCBs and there were reports of an explosion at Durdevik, which is assumed to have resulted in leakage. The PCB Inventory group was unable to examine the quantity of leaked fluids at these locations and so combined with the qualitative analysis undertaken, there is no quantification of the leakage available.</p>	<p>None.</p> <p><u>NIP (2015):</u> BiH has never manufactured PFOS, but only imported and used products that may contain PFOS.</p> <p><u>Inventory developed under "Environmentally Sound Management of Persistent Organic Pollutants (POPs) in Industrial and Hazardous Waste Sectors in BiH"</u>²² PFOS was most likely never produced in Bosnia and Herzegovina. No new consumer products containing PFOS are produced.</p>	<p>No specific data</p> <p><u>NIP (2015):</u> No information</p> <p><u>Inventory developed under "Environmentally Sound Management of Persistent Organic Pollutants (POPs) in Industrial and Hazardous Waste Sectors in BiH"</u> HBCD was most likely never produced in Bosnia and Herzegovina.</p>	<p>No specific data</p> <p><u>NIP (2015):</u> No information</p>
	Usage	<p>Negative consumption, PCB containing waste being exported (comprehensive import figures not available) 106,167 tonnes of waste containing PCBs</p> <p><u>NIP (2015):</u> A preliminary inventory of PCBs was carried out in 2013. A challenge that was encountered was that during the military siege a large number of power generation equipment was damaged and identification plates were damaged or have gone missing. Furthermore, from 1992 to present it is not possible to obtain information on the import of equipment containing PCB due to lacking legislation and customs regulations.</p> <p>PCBs in BiH are present in closed applications (transformers, capacitors and switches) and barrels used for storing used oil, and equipment containing PCBs is still being used. Among companies that were willing to cooperate with the studies, 106,167 tonnes of waste was identified (72% capacitors, 25% transformers and 3% in oil barrels). Given the methodological challenges, the real number may be higher.</p>	<p>Consumption between 47.16 and 284.20 tonnes (in 2012).</p> <p><u>NIP (2015):</u> Based on national statistics (import and export data), the total PFOS consumption in 2012 was between 47,159kg and 284,200 kg. The vast majority of this figure is associated with coating and coating additives (25,696 – 256,964 kg), followed by cleaning agents (waxes and polishes) and synthetic carpets. Due to inconsistencies in product codes (statistical data on production of items do not have the same production codes as customs tariffs for imported and exported products), the PBDEs/PFOS Inventory Group considers these calculations to be an estimate.</p> <p>A preliminary inventory of PFOS was carried out in 2013. Based on inventory analysis, the total quantities of fire-fighting foams in BiH in stocks amount to 8,455 litres, and the range of PFOS quantities in BiH is 4.22 to 12.67 litres.</p>	<p>290-590 tonnes present in buildings.</p> <p><u>NIP (2015):</u> No information</p> <p><u>Inventory developed under "Environmentally Sound Management of Persistent Organic Pollutants (POPs) in Industrial and Hazardous Waste Sectors in BiH"</u> No new EPS/XPS products containing HBCD are produced. Landfills represent one ultimate destination of HBCD containing materials. No stocks of HBCD were identified at the EPS/XPS industries. The total quantity of HBCD present in buildings is 290-590 tons, based on import and export data.</p>	<p>No specific data / Consent to import under specific conditions</p> <p><u>NIP (2015):</u> No information</p> <p><u>Inventory developed under "Environmentally Sound Management of Persistent Organic Pollutants (POPs) in Industrial and Hazardous Waste Sectors in BiH"</u> Not included</p> <p><u>Rotterdam Convention website</u>¹²: Consent to import under specific conditions:</p> <p>1. The production, placing on the market and use of substances or preparations containing SCCPs in concentrations lower than 1 % by weight shall be allowed.</p>

²² UNDP (ongoing project). Environmentally Sound Management of Persistent Organic Pollutants (POPs) in Industrial and Hazardous Waste Sectors
Technology Guide Development for sound POPs management in the Mediterranean region

	<p>In the period from 2008 to 2013, a total amount of approximately 350kg of PCBs were imported.</p> <p>A total of 2,814,155 kg of waste containing PCB was exported for processing between 2003 and 2013.</p> <p><u>Inventory developed under "Environmentally Sound Management of Persistent Organic Pollutants (POPs) In Industrial And Hazardous Waste Sectors In BiH"</u></p> <p>Based on information received from the Customs Sector of the Indirect Taxation Authority of Bosnia and Herzegovina,²³ in the period 2006-2020 a total of 457 kg of waste oils containing polychlorinated biphenyls (PCBs), polychlorinated terphenyls (PCTs) or polybrominated biphenyls (PBBs) was imported in Bosnia and Herzegovina and 363,776 kg was exported.</p> <p>With regards to mixtures containing halogenated derivatives of methane, ethane or propane containing polychlorinated biphenyls (PCBs), polychlorinated terphenyls (PCTs) or polybrominated biphenyls (PBBs), a total of 150 kg was imported in Bosnia and Herzegovina in the period 2006-2020, and no export was recorded.</p> <p>As part of the Med Partnership Project 'Environmentally sound management of equipment, stocks and wastes containing or contaminated by PCBs in national electricity companies of Mediterranean countries', in November 2015 a total of 111,018 kg of PCB containing or contaminated equipment and waste was exported from Bosnia and Herzegovina, of which 85,693 kg total solid and 20,345 kg total liquid. Given that according to the Indirect Taxation Authority of Bosnia and Herzegovina a total of 8,580 kg of waste oils containing PCBs was exported in 2015, it is assumed that only exported drums with liquid PCB were recorded within the Customs Sector of the Indirect Taxation Authority of Bosnia and Herzegovina. However, the Consultant could not obtain the information from Customs about the exported equipment containing PCBs given the lack of specific tariff code for transformers/capacitors containing PCBs.</p>	<p><u>Inventory developed under "Environmentally Sound Management of Persistent Organic Pollutants (POPs) In Industrial And Hazardous Waste Sectors In BiH"</u></p> <p>PFOS was used as a mist suppressor in the electroplating industry until 2015. The wastewater from the galvanisation baths is treated in a wastewater plant and/or hazardous waste companies. Due to the past unsound management of wastewater in these industries, potentially PFOS has been released to the environment.</p> <p>Over the period from 2004 to 2016, a total of 10,994 kg PFOS and related chemicals were imported.</p>		<p>2. The production, placing on the market, and use of the following applications shall be allowed provided that report on the progress made to eliminate SCCPs is submitted to the Ministry of Health and Social Welfare no later than 2015 and every four years thereafter:</p> <p>(a) fire retardants in rubber used in conveyor belts in the mining industry;</p> <p>(b) fire retardants in dam sealants.</p> <p>3. Placing on the market and use of articles containing SCCPs as a constituent of such articles shall be allowed until 31 December 2013 if they are produced before or on 3 August 2013.</p>
--	--	---	--	--

²³ Information provided to Dekonta as part of this study

POPs Baseline	PCBs	PFOS	HBCD	SCCP
Egypt	Production	<p>Limited specific data</p> <p><u>NIP (2005):</u> No information</p> <p><u>IPEN Egypt PFAS situation report (2019)²⁴</u> Currently there is no information available on production of PFAS substances in Egypt.</p>	<p>No specific data</p> <p><u>NIP (2005):</u> No information</p>	<p>None</p> <p><u>NIP (2005):</u> No information</p> <p>The Preliminary inventory shared by the national focal point states that according to the data received from the Chemical Industry Chamber- Ministry of Industry, SCCPs officially are not produced in and/or exported to Egypt.</p>
	Usage	<p>20.5 tonnes of PCB oil in transformers that remain in service</p> <p><u>NIP (2005):</u> Usage is banned in Egypt.</p> <p>At the time of the first NIP publication, there was no existing inventory data on PCBs. However, a preliminary inventory concluded that there were 3,666 condensers and 26 transformers manufactured between 1955 and 1977.</p> <p>PCBs were used widely in transformers, capacitors, voltage regulators, hydraulic systems, small capacitors in fluorescent lighting ballasts, and heat transfer systems. Quantities for the latter category have not been reported, presumably because they are too small.</p> <p>The transformers contain 20,490 kg of oil that contains PCBs.</p> <p><u>IPEN Report on PCBs (2019)²⁴</u> Highlights difficulty of obtaining data as the users of PCBs are reluctant to share information out of fear they may be subject to fines or other liabilities. Notwithstanding these difficulties, a joint effort of the Ministry of Environment, Ministry of Electricity and the World Bank led to the sampling of 18,750</p>	<p>Limited specific data</p> <p><u>NIP (2005):</u> No information; the Stockholm Convention amendment listing PFOS came into force for Egypt in 2010, an updated NIP has not been published since.</p> <p><u>IPEN Egypt PFAS situation report (2019)²⁴</u> Currently there is no information available on production, import, use or management of PFAS substances in Egypt, nor on PFAS impacts or contaminated sites. PFAS are unregulated in Egypt.</p> <p>Studies cited in this report show that products such as food contact paper were contaminated with PFAS substances, and PFOS/PFAS was also encountered in dust analysed in 17 homes, 5 workplaces and 9 cars in Cairo.</p> <p>Currently there is no information available on production, import, use or management of PFAS substances in Egypt.</p>	<p>243 and 1,655 tonnes per year in transport textiles sector (as of 2016).</p> <p><u>NIP (2005):</u> No information</p> <p>The Preliminary inventory shared by the national expert has not yet identified any usage of HBCD as additive material in the manufacturing of polystyrene.</p> <p>In the textile sector, the preliminary inventory states that HBCD use can be assumed until about 2013/14; after 2015 it is less likely to be used.</p> <p>There are no data on using HBCD in the transport textiles sector, though using the UNEP guidelines the consumption is estimated between 243 and 1,655 tonnes per year as of 2016.</p>

²⁴ IPEN 2005. Country Situation Report for Egypt.

	<p>suspected transformers, out of which 11,123 were analysed. 711 of these turned out to be contaminated, with a total of 948 tons of contaminated oil.</p> <p>Five projects were implemented between 2006 and 2016, which included the disposal of several stockpiles of contaminated oils.</p> <p><u>UNEP 2016 Press release²⁵</u> As part of the MedPartnership Project, led by UNEP/MAP and funded by the Global Environment Facility (GEF), Egypt undertook to gather PCB-contaminated equipment in Cairo and Alexandria to ship them to Spain for elimination, with the goal of disposing 200 tonnes of PCBs.</p> <p>Historical production unclear but unlikely to be significant.</p> <p>Over the years a number of different initiatives have been undertaken in Egypt to create inventories of PCBs. These include:</p> <ul style="list-style-type: none"> • Regional Environmental Management Improvement Project (JICA 2006-2008) • Sustainable management of POPs project (GEF-WB phase 1 2010; phase 2 2015) • Integrated PCBs Management Project (MEDPOL/UNEP 2011-2016) <p>The main holder of PCB-contaminated equipment is the Ministry of Electricity and Renewal Energy "Mere". Petrotrade Company (and its subcontractors) is the only authorised company to collect oils and to give to Alexandria Petroleum Company and AMOC Company. These companies are holding potentially contaminated oil and recycle it thus leading to dilution and dispersion.</p>	<p>The Preliminary inventory shared by the national focal point includes an analysis of PFOS in various sectors:</p> <ul style="list-style-type: none"> • <u>Paper and packaging</u>: PFOA detected in 79% of samples with median concentration of 2.40ng/g. PFOS detected in 58% of samples with median concentration of 0.29ng/g. Total amounts: 66.67g PFOA and 8.06 PFOS in paper products used for food packaging. • <u>Textiles</u>: likely PFOS-free, alternatives used such as C6-Fluorocarbon resin with hyper branched polymers in a hydrocarbon matrix, cationic). 		
--	---	---	--	--

²⁵UNEP, 2016. Egypt disposes of its PCB-contaminated equipment.

POPs Baseline	PCBs	PFOS	HBCD	SCCP
Lebanon	Production	<p>None.</p> <p><u>NIP (2017)</u> PFOS and related substances are currently not produced in Lebanon.</p>	<p>None.</p> <p><u>NIP (2017)</u> HBCD is currently not produced in Lebanon as per information retrieved during the 2016 assessment covering the period of 2004-2014</p>	<p>No specific data</p> <p><u>NIP (2017)</u> No information</p>
	Usage	<p>None / negative (due to export for disposal).</p> <p><u>NIP (2017)</u> Lebanon's substations use and have been using PCB-free oil for many years. PCB oil or PCB contaminated oil may nevertheless be present in substations subject to more extensive testing.</p> <p><u>World Bank Blog (2021)</u> With WB support and GEF funding, Lebanon undertook a project (May 2015 – Mar 2021) to eliminate PCB contaminated power transformers in an environmentally sound manner. 23,044 assets were surveyed, identifying 1,380 transformers contaminated with PCBs. In total 389 tonnes of hazardous waste was disposed of (shipped to a licenced facility in France in accordance with the Basel Convention) A draft legal decree that ensures the effective management of PCBs was also developed, aligning regulations with the priorities set by the Stockholm Convention. 1,435 tonnes of PCB contaminated transformers remain to be eliminated.</p>	<p>Limited specific data</p> <p><u>NIP (2017)</u> An estimated 56 to 167 kg of PFOS were released between 2004 and 2014 from fire-fighting foams.</p> <p>A total of 6,240 litres of PFOS containing fire-fighting foam were used in fire incidents in Great Beirut between 2004 and 2014, over a total surface area of 5,960m².</p> <p><u>Lebanon PFAS Situation Report (2019)</u>²⁸ Currently no national inventory of PFAS substances. No specific PFAS regulations have been implemented yet. Fire-fighting foams are a likely major source of PFAS; PFAS-containing AFFF foams are imported into Lebanon, primarily for use at gas stations.</p>	<p>Limited specific data</p> <p><u>NIP (2017)</u> (Data incomplete as high proportion of contacted firms did not respond)</p> <p>EPS construction insulation Foams: total import of 3,300 tonnes of HBCD between 2004 and 2014.</p> <p>Textile and Paints: no specific figures.</p>

³⁸ GEF. POPs legacy elimination and POPs release reduction project.

³⁹ Turkiye istatistik Kurumu, 2022.

4. Identification of priority sectors

4.1 Introduction

Based on the findings of the country-specific research summarised in the preceding section, priority sectors have been identified for each of the four target POPs in the eight countries of interest, as set out in Table 2 below.

A number of other sectors were considered but were discounted from further detailed consideration on the basis of *inter alia* the size of that sector compared with others or the low use of POPs in that sector for the ENVITECC countries, meaning that they were not classed as a priority use area or sector.

Sectors reviewed, but excluded from further detailed investigation, are summarised below for completeness, with reasons given for their exclusion.

4.2 Sectors excluded from further consideration

4.2.1 PFOS and associated salts

Household cleaning products and detergents

There is no reference to the potential presence of PFOS in household cleaning products and detergents in either the BAT/BEP Guidance⁴⁰, or the OECD report⁴¹. A 2015 paper⁴² which analysed the presence of PFAS in a wide range of consumer products notes that PFAS can be contained in industrial detergents but makes no reference to the potential for PFOS contamination.

However, three of the NIPs make reference to PFOS in household cleaning products and detergents as follows:

Albania: Provides estimate of PFOS potentially present in 'cleaning house products' using PFOS content of 0.005 – 0.01%, which results in a maximum range of 50 – 100 kg annually.

Bosnia and Herzegovina: No data or estimates given

Montenegro: Provides estimates of PFOS potentially present in cleaning agents, waxes and polishes for the three years 2014 – 2016 using PFOS content of 0.005 – 0.01%, which results in a maximum range of 13.6 – 36.4 kg annually.

Given that both the Albania and Montenegro NIPs assumed that all imported materials within the category contain PFOS, and that the more recent UNEP/OECD documents make no reference to this sector as a potential source of POPs, the masses predicted are likely to be a significant overestimate. This sector has therefore not been considered further.

⁴⁰ UNEP (2021). Guidance on best available techniques and best environmental practices for the use of perfluorooctane sulfonic acid (PFOS), perfluorooctanoic acid (PFOA), and their related substances listed under the Stockholm Convention on Persistent Organic Pollutants.

⁴¹ OECD, 2015: Risk reduction approaches for PFASs – a cross country analysis

⁴² Kotthoff, M et al, 2015. Perfluoroalkyl and polyfluoroalkyl substances in consumer products

Hydraulic fluids

Aviation hydraulic fluids were formerly an acceptable purpose for use of PFOS but were removed under decision SC-9/4, which entered into force on 3 December 2020; there are no specific exemptions registered for this use in the ENVITECC countries.

Aviation hydraulic fluids previously contained a PFOS-related substance, or precursor, at concentrations of typically <math><0.05\%^{43}</math> – 0.1%⁴⁴ to prevent evaporation, fires and corrosion, although it should be noted that PFOS-free alternatives were available, and widely used before 2020.

Alternative fluorine-free chemicals are now used instead, as are fluorinated chemicals other than PFOS. However, some of the fluorinated chemicals are likely to have POPs-like characteristics in terms of persistence.

Detailed information on the properties of alternatives is restricted by manufacturers because of commercial sensitivities, although the majority of aviation hydraulic fluids contain phosphate esters. Hydraulic fluids used in other applications, which have less restrictive specifications may be phosphate ester free or biodegradable.

Six of the eight NIPs make reference to hydraulic fluids as follows:

Albania:	Provides estimate of PFOS potentially present based on assumed consumption of 10,000 kg and PFOS concentration of 0.05-0.1% which results in an annual range of 5 – 10 kg PFOS.
Bosnia and Herzegovina:	No data or estimates given
Lebanon:	Data received from Middle East Airlines maintenance department showed that only PFOS free hydraulic fluids were used over the period 2004 – 2014.
Montenegro:	Provides estimates of PFOS potentially present in aviation hydraulic fluid based on amounts of hydraulic fluid used each year over the period 2006 – 2015 and using the typical concentrations of PFOS added of 0.05-0.1% which results in a maximum range of 0.12 – 0.62 kg of PFOS annually. However, the hydraulic fluid mentioned in the NIP (Skydrol 500-B4) is PFOS free ⁴⁵ and therefore the estimates should be treated with extreme caution.
Morocco:	Provides estimate of PFOS potentially present based on total imports of 18,089 kg and PFOS concentration of 0.05-0.1% which results in an annual range of 9.0 – 18.1 kg PFOS.
Türkiye:	Table AIV/24 in the NIP indicates that Türkiye is a significant net exporter of aviation hydraulic fluids. However, no estimate is provided for the

⁴³ UNEP (2021). BAT / BEP guidance on practices for the use of perfluorooctane sulfonic acid (PFOS), perfluorooctanoic acid (PFOA), and their related substances listed under the Stockholm Convention on Persistent Organic Pollutants

⁴⁴ UNEP (2011) Guidance on alternatives to PFOS and its derivatives (UNEP/POPS/POPRC.6/13/Add.3f)

⁴⁵ Eastman, 2014. PFOS in Skydrol® aviation hydraulic fluids

approximate PFOS amounts for the listed categories (e.g. engine oils, compressor and turbine oils, etc.), and some of these may not even contain PFOS.

Historic or current data concerning quantities of hydraulic fluids used at a regional / global level are not available⁴⁶ and it is therefore not possible to attempt to estimate the amounts of PFOS that may have been used; any attempt at estimation would be further complicated by the fact that PFOS-free alternatives have been in use for some time and so using the range of 0.05 – 0.1% is likely to lead to an overestimation. A recent paper⁴⁷ indicated that the hydraulic fluid in an airbus A320 would be completely replaced in 13 months through maintenance / topping up; this would indicate that any remaining PFOS-containing hydraulic oil would now have been replaced.

The data in the NIPs where an estimate has been made should be treated with caution for the reasons given above and are likely to be overestimates; even so, the quantities predicted in the eight countries are far lower than those arising in other uses and so this sector has not been considered further.

Metal plating

Metal plating defined as “...(*hard metal plating*) only in closed-loop systems” remains as a specific exemption under decision SC-9/4, which entered into force on 3 December 2020. The exemption specifically relates to functional chromium plating, whereby a layer of chromium is directly deposited onto substrates using electrolysis to provide a corrosion resistant surface.

Electrolysis is a wet process and PFOS or other fluorinated wetting agents are used to reduce surface tension of the liquid to reduce drag-out losses from the plating bath and to improve surface quality of the products. Most importantly, the electrolytic process can cause bubbles and mist to be ejected from the plating bath; this mist is released to the work environment and eventually ambient air unless controlled with air pollution control equipment and/or chemical fume (mist) suppressants. The use of PFOS (or other wetting agents) therefore plays a key role in reducing the Cr(VI) concentration in the working air⁴⁸.

The most common alternative (6:2 fluorotelomer sulfonate (FTS), which is marketed under several trade names) is much less stable than PFOS, which means that a much greater amount (up to ten times more) is needed, relative to PFOS, to achieve the same protective effect. Moreover, 6:2 FTS degrades to perfluorohexanic acid, which is itself a PFAS. All known alternatives contain fluorine.

The BAT/BEP guidance⁴⁹ refers to a number of alternative processes for hard metal plating that are available in Europe but notes that none can cover all the applications of functional chromium plating.

⁴⁶ Stockholm Convention [u.d.]. POPRC.8 Documents.

⁴⁸ Chromium (VI) is itself extremely toxic and a known carcinogen

⁴⁹ UNEP (2021). BAT / BEP guidance on practices for the use of perfluorooctane sulfonic acid (PFOS), perfluorooctanoic acid (PFOA), and their related substances listed under the Stockholm Convention on Persistent Organic Pollutants

Six of the eight NIPS make reference to metal plating as follows:

Bosnia and Herzegovina:	Reference but no data
Lebanon:	Ten metal plating companies were contacted although only five responded, all of whom were decorative metal platers for which there is no exemption for the use of PFOS; two respondents stated that they were not using PFOS. However, the NIP concludes that it is possible that PFOS is still in use but no estimates are given.
Montenegro:	Reference but no data
Morocco:	Reference but no data
Tunisia:	Reference but no data
Türkiye:	Although metal plating is identified as a priority sector for PFOS, there is no further reference to metal plating and no data are provided.

Paints, adhesives, coatings

The specific exemption allowing the use of PFOS in coatings and coating additives was removed in 2015 under decision SC-7/5. However, production had peaked between 1990 – 2000⁵⁰ and their use had been largely phased out before this date following the decision of the main global manufacturer, 3M to phase out PFOS in 2000⁵¹, with production having completely ended two years later⁵². Moreover, a recent OECD report⁵³ on the commercial availability and current uses of PFAS in coatings, paints and varnishes found no evidence of PFOS in any uses.

Albania:	Provides estimate of PFOS potentially present based on assumed consumption of 10,000 kg and PFOS concentration of 0.05-0.1% which results in an annual range of 5 – 10 kg PFOS.
Bosnia and Herzegovina:	No data or estimates given.
Lebanon:	Paint and varnish factories surveyed (ten out of twelve responses) stated that no chemicals containing PFOS used in their production. MSDS of a further two factories previously audited were reviewed and no PFOS containing materials were detected.
Montenegro:	Provides estimates of PFOS potentially present in surface coating, paints and varnishes based on total amounts imported each year over the

⁵³ OECD, 2022: Per- and Polyfluoroalkyl Substances and Alternatives in Coatings, Paints and Varnishes (CPVs), Report on the Commercial Availability and Current Uses, OECD Series on Risk Management, No. 70, Environment, Health and Safety, Environment Directorate.

period 2014 – 2016 and using a PFOS concentration of 0.01% which results in a maximum range of 3.2 – 5.8 kg of PFOS annually.

Tunisia: No data or estimates given

Türkiye: No data or estimates given

It should be noted that the inventory guidance notes that PFOS were only added in specific limited circumstances⁵⁴; given that both the Albania and Montenegro NIPs assumed that all imported materials contain PFOS, the masses predicted are likely to be a significant overestimate.

Even so, the quantities predicted are far lower than those arising in other uses and so this sector has not been considered further.

Photo-imaging

Photo-imaging was formerly an acceptable purpose for use of PFOS but was removed under decision SC-9/4, which entered into force on 3 December 2020.

Whilst the amounts of PFOS materials used in the photo-imaging industry have decreased, there remains a small number of critical uses where direct alternatives do not exist⁵⁵ or there is insufficient, or contradictory, information available in relation to suitable alternatives⁵⁶, several of which are considered to be potential POPs. Indeed, the SC website still notes that 'for some applications like photo imaging ...technically feasible alternatives to PFOS are not available to date'⁵⁷.

The quantities of PFOS potentially arising from this industry are low when compared with other uses. Work undertaken by UK DEFRA⁵⁸, estimates releases into wastewater and air from the photo-imaging industry to be 1.02 kg and 0.051 kg respectively from manufacturing uses in the EU, which has been extrapolated to less than 2 kg globally.

Based on the reductions in the use of PFOS in photo-imaging between 2000-2004, UNEP⁵⁹ estimated the costs of further reductions as US\$25M/ kg assuming an annual estimated global release of 2kg. It is also worth noting that with the increased take up, and now prevalence, of the use of digital imaging technologies since these calculations were undertaken, there will have been an associated reduction in demand for film and therefore a significant reduction in the amount of PFOS being used.

Five out of the eight NIPs (Albania, Bosnia and Herzegovina, Montenegro, Morocco, and Tunisia) refer to the use of PFOS in the photo-imaging industry. However, an estimate of the

⁵⁴ UNEP, 2017. Guidance for the inventory of perfluorooctane sulfonic acid (PFOS) and related chemicals listed under the Stockholm Convention on Persistent Organic Pollutants UNEP/POPS/COP.7/INF/26

⁵⁵ For example, PFOS materials have a combination of surface-active properties that are not found in any other single class of chemicals. Michiels E., 2010. The use of PFOA in critical photographic applications (cited in UNEP, 2021).

⁵⁸ AEA, 2012. A further update of the UK source inventories for emissions to air, land and water of dioxins, dioxin-like PCBs, PCBs and HCB, incorporating multi-media emission inventories for nine new POPs under the Stockholm Convention. Report Ref ED47664

⁵⁹ UNEP, 2007. Report of the Persistent Organic Pollutants Review Committee on the work of its third meeting: Addendum - Risk management evaluation on perfluorooctane sulfonate UNEP/POPS/POPRC.3/20/Add.5

amount of PFOS resulting from these uses is only given in the Albanian and Moroccan NIPs as follows:

Albania: Provides estimate of PFOS potentially present based on annual consumption of 50,000 kg and PFOS concentration of 0.02-0.1% which results in an annual range of 10 – 50 kg PFOS.

Morocco: Provides estimate of PFOS potentially present based on net annual consumption of 93,138 kg and PFOS concentration of 0.01% which results in an annual quantity of 9.3 kg PFOS.

It should be noted that the estimates given in the Albanian and Moroccan NIPs represent a significant percentage of the estimated global total in 2010; given that consumption will have decreased considerably over the last decade, the estimates should be treated with caution.

However, given the relatively small quantities of PFOS used in this industry globally, and the further decrease in use resulting from the switch to digital technologies, and the fact that quantities predicted are far lower than those arising in other uses for the two ENVITECC countries where an estimate has been made, this sector has not been considered further.

4.2.2 HBCD

The inventory guidance on HBCD⁶⁰ notes that over 90% of HBCD globally is in EPS and XPS in the construction sector, with a small amount of use in textiles and electronics. In the EU, the uses in electronics and in textiles are each estimated at 2%. The focus of the BAT/BEP guidance⁶¹ on HBCD is solely on the EPS and XPS sectors.

However, there is reference to the minor uses in some of the NIPs, which are included below for completeness although they are not considered further.

Electronics

Of the six NIPs which include HBCD, only two include reference to the potential for HBCD in the electronics sector as follows:

Albania: Identifies that HBCD is used in electrical and electronic devices with a concentration of 1-7% (baseline / reference for this concentration is not given). Given that the concentration of HBCD in electrical and electronic equipment is low, no data or estimates have been made.

Morocco: Identifies that HBCD is used, to a minor extent, as a flame-retardant additive in polystyrene shockproof electronic equipment. However, in accordance with the Inventory Guidelines, it is not considered relevant to establish an inventory as the presence of HBCD in this type of product is considered insignificant.

⁶⁰ UNEP, 2021. Guidance on preparing inventories of hexabromocyclododecane (HBCD).

⁶¹ UNEP, 2021: Guidance on best available techniques and best environmental practices for the use of hexabromocyclododecane listed with specific exemptions under the Stockholm Convention

Food packaging

Of the six NIPs which include HBCD, only one includes any reference to the potential for HBCD in food packaging as follows:

Tunisia: Gives total annual quantities of HBCD used of circa 85 tonnes and states that this is principally used in polystyrene for construction and food packaging but no breakdown given of the amount in each sector.

Paints

Of the six NIPs which include HBCD, three include reference to the potential for HBCD in paints as follows:

Albania: Single reference to fact that whilst paints may contain HBCD, the concentration is low and so no data or estimates have been made.

Lebanon: Single reference noting that paints were not considered because it represents a minor potential use of HBCD.

Morocco: Reference given to the use of HBCD in latex paints (and coatings, glues and binders), but that the use of HBCD in these products is minor overall and it is not established that HBCD is contained in these products in Morocco

Table 2: Priority use areas and sectors for the target POPs in Each ENVITECC country

Priority Use Area	PCBs	PFOS	HBCD	SCCP
Albania				
(1) Exposure to POPs at homes and offices (through uses such as carpets, paints, fire extinguishers, office furniture, construction materials – cable insulation, sealants, adhesives etc.)	N/A	Cardboard, paper and packaging Carpets Textiles Leather	Textiles in household furniture Textiles in vehicle upholstery Insulation foams (EPS/XPS) used in construction Mattresses	Not reported
(2) POPs release to the environment due to industrial/commercial scale production and use of POPs containing fire-fighting foams (at petrochemical sites, refineries, airports, etc.)	N/A	Fire-fighting foams	Not reported	Not reported
(3) Intentional industrial uses of POPs in the manufacturing industry (textile, paper, chemicals etc.)	N/A	Cardboard, paper and packaging Carpets Textiles Leather	Textiles in household furniture Textiles in vehicle upholstery Insulation foams (EPS/XPS) used in construction Mattresses	Not reported
(4) Unintentional release of POPs to the environment from industrial processes	Energy (Electricity / Transformers)	N/A	N/A	Not reported
(5) Other area of use or sector, if any (please identify)	N/A	N/A	N/A	Not reported
Bosnia and Herzegovina				
(1) Exposure to POPs at homes and offices (through uses such as carpets, paints, fire extinguishers, office furniture, construction materials – cable insulation, sealants, adhesives etc.)	N/A	Coatings and coating additives Carpets Cleaning agents Textiles	Not reported	Not reported
(2) POPs release to the environment due to industrial/ commercial scale production and use of POPs containing fire-fighting foams (at petrochemical sites, refineries, airports, etc.)	N/A	Fire-fighting foams	Not reported	Not reported

Priority Use Area	PCBs	PFOS	HBCD	SCCP
(3) Intentional industrial uses of POPs in the manufacturing industry (textile, paper, chemicals etc.)	N/A	N/A	Not reported	Not reported
(4) Unintentional release of POPs to the environment from industrial processes	Energy (Electricity / Transformers) Mining NB: During the military siege a large amount of power generation equipment was damaged - significant hotspots where PCBs may have leaked.	N/A	Not reported	Not reported
(5) Other area of use or sector, if any (please identify)	N/A	N/A	N/A	N/A
Egypt				
(1) Exposure to POPs at homes and offices (through uses such as carpets, paints, fire extinguishers, office furniture, construction materials – cable insulation, sealants, adhesives etc.)	N/A	Not reported	Not reported	Not reported
(2) POPs release to the environment due to industrial/ commercial scale production and use of POPs containing fire-fighting foams (at petrochemical sites, refineries, airports, etc.)	N/A	Not reported	Not reported	Not reported
(3) Intentional industrial uses of POPs in the manufacturing industry (textile, paper, chemicals etc.)	N/A	Not reported	Not reported	Not reported
(4) Unintentional release of POPs to the environment from industrial processes	Energy (Electricity / Transformers)	Not reported	Not reported	Not reported
(5) Other area of use or sector, if any (please identify)	N/A	Not reported	Not reported	Not reported
Lebanon				
(1) Exposure to POPs at homes and offices (through uses such as carpets, paints, fire extinguishers, office furniture, construction	N/A	NIP reports no significant PFOS use in any industry sectors based on interviews.	Insulation foams (EPS/XPS) used in construction Textiles	Not reported

Priority Use Area	PCBs	PFOS	HBCD	SCCP
materials – cable insulation, sealants, adhesives etc.)				
(2) POPs release to the environment due to industrial/ commercial scale production and use of POPs containing fire-fighting foams (at petrochemical sites, refineries, airports, etc.)	N/A	Fire-fighting foams	N/A	Not reported
(3) Intentional industrial uses of POPs in the manufacturing industry (textile, paper, chemicals etc.)	N/A	N/A	Insulation foams (EPS/XPS) used in construction Textiles	Not reported
(4) Unintentional release of POPs to the environment from industrial processes	Energy (Electricity / Transformers) NB: Several power plants and substations sustained serious damage or were totally destroyed and are therefore potentially contaminated.	N/A	N/A	Not reported
(5) Other area of use or sector, if any (please identify)	N/A	N/A	N/A	Not reported
Montenegro				
(1) Exposure to POPs at homes and offices (through uses such as carpets, paints, fire extinguishers, office furniture, construction materials – cable insulation, sealants, adhesives etc.)	N/A	Carpets Textiles Paper and packaging Cleaning agents	Insulation foams (EPS/XPS) used in construction	Not reported
(2) POPs release to the environment due to industrial/ commercial scale production and use of POPs containing fire-fighting foams (at petrochemical sites, refineries, airports, etc.)	N/A	Fire-fighting foams	N/A	Not reported
(3) Intentional industrial uses of POPs in the manufacturing industry (textile, paper, chemicals etc.)	N/A	N/A	Textile Paints Furniture Building materials	Not reported
(4) Unintentional release of POPs to the environment from industrial processes	Energy (Electricity / Transformers)	N/A	N/A	Not reported

Priority Use Area	PCBs	PFOS	HBCD	SCCP
(5) Other area of use or sector, if any (please identify)	N/A	N/A	N/A	Not reported
Morocco				
(1) Exposure to POPs at homes and offices (through uses such as carpets, paints, fire extinguishers, office furniture, construction materials – cable insulation, sealants, adhesives etc.)	N/A Existing PCBs reported in NIP are only present in electric transformers. Hence exposure at homes and offices minimal.	Paper and packaging Carpets Synthetics Leather and clothing Textiles and upholstery Net consumption between 1,276.80 and 12,768.30 kg per year.	Insulation foams used in construction (EPS and XPS) net consumption between 93,264 and 229,383 kg (HBBCD rarely used in interior textiles as well as clothing textiles in Morocco)	Not reported
(2) POPs release to the environment due to industrial/ commercial scale production and use of POPs containing fire-fighting foams (at petrochemical sites, refineries, airports, etc.)	N/A	Not reported	Not reported	Not reported
(3) Intentional industrial uses of POPs in the manufacturing industry (textile, paper, chemicals etc.)	N/A	Aviation Hydraulic Fluids: Net consumption between 9 and 18 kg per year Photography: Net consumption 9.3kg per year	Usage in manufacturing of buses, cars, and trucks: Net consumption between 242 and 1,650 kg	Not reported
(4) Unintentional release of POPs to the environment from industrial processes	Energy (Electricity / Transformers)	Not reported	Not reported	Not reported
(5) Other area of use or sector, if any (please identify)	Not reported	Not reported	Not reported	Not reported
Tunisia				
(1) Exposure to POPs at homes and offices (through uses such as carpets, paints, fire extinguishers, office furniture, construction materials – cable insulation, sealants, adhesives etc.)	N/A	Not reported	Insulation foams (EPS/XPS) used in construction Food packaging	Not reported

5. Technology guide development

5.1 Introduction

This section details off-the-shelf technologies used in the avoidance, treatment, and disposal of POPs. For the priority sectors identified for each target POPs, the availability of technologies has been considered under the headings of Avoidance, Treatment / Remediation and Safe Disposal and categorised as follows:

Technologies commercially available, with no regrettable consequences.

Technologies currently not commercially available, or available technologies are associated with regrettable consequences e.g. are potential POPs or have POPs like characteristics.

Technologies not available, or limited data

Where alternatives to POPs are provided, further detail regarding environmental impacts, application constraints and financial costs are given in Table 3 of this report.

It should be noted that the inclusion of a particular technology provider does not constitute a recommendation for that company or their technology, rather the purpose is to illustrate the options that exist for a POPs-free alternative for the specific use or context under consideration.

5.2 PCBs

PCBs were banned in 2001, and their use is now therefore highly restricted. Furthermore, the parties to the Convention are required to eliminate the use of PCBs in existing equipment by 2025 and ensure their environmentally sound waste management by 2028. Technologies are therefore only available for the Energy Sector, where PCBs may still be present, principally in oils in transformers and capacitors, although there is little variation in use across the eight countries.

Priority sector:	Avoidance	Treatment/ Remediation	Safe Disposal
Energy			

5.3 PFOS

PFOS, its salts and PFOSF were listed in Annex B to the Stockholm Convention in 2009 (decision SC-4/17). Previously, their main use was in carpet manufacturing (90% by weight of total PFOS in the EU) followed by fire-fighting foam and the leather industry⁶². However, with the removal of the specific exemptions and acceptable uses under subsequent SC decisions, the principal exposure to PFOS is from existing stocks of textiles and materials (including carpets) where PFOS has been used as a coating and fire-fighting foams.

The EU restriction on the inclusion of PFOS is 1 microgram per square metre (1µg/m²) on textiles and other coated products⁶³. Technologies for the treatment and safe disposal of PFAS containing products are available but limited, and costs are likely to be the greatest applicability constraints.

Priority sector:	Avoidance	Treatment/ Remediation	Safe Disposal
Coatings (textile, paper, carpet)			
Fire-fighting foams			

5.4 HBCD

HBCD is most commonly used as insulation, in extended polystyrene (EPS) and extruded polystyrene (XPS)⁶⁴, and as flame retardants in textiles.

Alternatives for insulation and textile uses are often POPs or have POPs like qualities. Many are also not commercially available.

Priority sector:	Avoidance	Treatment/ Remediation	Safe Disposal
Insulation			
Textiles			

5.5 SCCPs

Data are extremely limited, as only the Türkiye NIP has been updated since SCCPs were added to the Stockholm Convention in 2017. National experts were not able to provide further information.

Priority sector:	Avoidance	Treatment/ Remediation	Safe Disposal
Flame retardants			
Sealants and adhesives			
Paints and coatings			
Polyvinyl chloride processing			
Metalworking fluids			

⁶² Expert Team to Support Waste Implementation (ESWI) 2011: Study on waste related issues of newly listed POPs and candidate POPs.

⁶³ COMMISSION REGULATION (EU) No 757/2010, Annex I of the Regulation (EC) No 850/2004 on POPs.

⁶⁴ Both EPS and XPS are closed-cell foams used for insulation purposes. They consist of the same base materials however are manufactured differently, such that XPS is considerably denser than EPS.

Table 3a: Technology guide – PCBs

Target POPs: PCBs	POPs Management Measures	Available technologies and/or practices	Parameters to characterise efficiency and eligibility	Applicability Constraints	Technology Providers and CAPEX/ OPEX
Priority Use Area #1 – Exposure to POPs at homes and offices					
No exposure to PCBs in homes and offices, as PCBs were banned in 2001.					
Priority Use Area #2 – POPs release to the environment due to industrial/commercial scale production					
Priority Use Area #3 – Intentional industrial uses of POPs in the manufacturing industry					
Priority Use Area #4 – Unintentional release of POPs to the environment from industrial processes					
Energy (through leakage) (PCB in oils of transformers, capacitors, circuit breakers)	Avoidance (through replacement with available alternatives)	(1) Replacement with alternative oils: a. Univolt transformer oil b. ENI ITE 600 c. Nynas NYTRO (2) Facilitating access to potentially leaky equipment, use of high integrity equipment (according to BAT/BEP)	Oxidation stability, corrosive sulphur production, seal compatibility, safety, viscosity	Financial, local availability	(1) Univolt transformer oil (2) ENI ITE 600 (3) Nynas NYTRO
	Treatment/remediation	No data	No data	No data	No data
	Safe Disposal	Available technologies drawn from Basel Convention technical guidelines ⁶⁵ : (1) Alkali metal reduction (2) Base catalysed decomposition (3) Catalytic hydrochlorination ⁶⁶ (4) Plasma arc ¹³	(1) High energy requirements: typically the process operates at atmospheric pressure (sometimes up to 4 atmospheres) and temperatures between 100°C and 180°C. ⁶⁸ (2) De-chlorination efficiency	(1) No data (2) No data (3) No data (4) PLASCON technology is currently not operating in target countries. There are 4 PCB plants operating in Japan. Pre-treatment is required as the process requires	(1) No data (2) Comparatively inexpensive (3) No data (4) PLASCON (5) Operational costs of furnace at temperatures between 850-1800°C are between ~€0.3 - 1.5 /litre. High temperature incineration (6000°C) costs ~€11 /litre. For fluorine free foams,

¹⁰⁶ UNEP, 2019. General technical guidelines on the environmentally sound management of wastes consisting of, containing or contaminated with persistent organic pollutants (UNEP/CHW.14/7/Add.1/Rev.1)

Target POPs: SCCPs	POPs Management Measures	Available technologies and/or practices	Parameters to characterise efficiency and eligibility	Applicability Constraints	Technology Providers and CAPEX/OPEX
		<ul style="list-style-type: none"> • (e.g. oil-in-CO₂ dispersion) • gas-based lubricant system (2) Replacement with HIGTO(1) (rapeseed based modified triglyceride) with a zirconium coating. (3) Replacement with other alternatives • Alkanol amides (e.g., 2:1 di-ethanolamine (DEA) tall oil fatty acid alkanol amide) • Isopropyl oleate • Long-chain chlorinated paraffins (C18+) (LCCPs) • Medium-chain chlorinated paraffins (C14-17) (MCCPs) • Nitrated compounds (e.g. Doverlube NCEP-nitrogen containing compound) • Overbased calcium sulphonates • PEP additives • Phosphorus based compounds (4) Use of alternative techniques • Gas based systems such as supercritical CO₂. 			
	Treatment/remediation	(1) Effective segregation is required. Spills and contamination to wastewater should be	(1) Segregation methods can be costly and require energy intensive processes ⁹⁶ .	(2) Availability and financial	(3) Costs vary by method; limited data available.

Target POPs: SCCPs	POPs Management Measures	Available technologies and/or practices	Parameters to characterise efficiency and eligibility	Applicability Constraints	Technology Providers and CAPEX/OPEX
		minimized. There are several technologies used for recycling and treatment of metalworking fluids. Gravity and vacuum filtration are used to separate solids. Generally, disposable filters are used. Hydrocyclones and Ultrafiltration are other methods of treatment ¹⁰⁷ .			
	Safe Disposal	Potentially available technologies drawn from Basel Convention technical guidelines ¹⁰⁸ : (1) Hazardous waste incineration (including cement kiln co-incineration) (2) Gas phase chemical reduction (3) Supercritical and subcritical water oxidation (SCWO)	(1) Energy intensive as well as high temperatures required (2) No data for SCCP (3) No data for SCCP although SCWO is energy intensive and operates at high temperature and pressure	(1) High energy requirements, heating up to 1400°C (2) No data for SCCP (3) No data for SCCP specifically	(1) There is a hazardous waste incineration facility in Turkey (IZAYDAS), and there are also a number of facilities across the EU, which may be available. (2) No facilities in Europe / MENA region (3) No available facilities – one small SCWO research plant in France Note that export of POPs contaminated wastes for disposal is governed by the requirements of the Basel Convention on the control of the transboundary movements of hazardous wastes and their disposal.
Priority Use Area #4 – Unintentional release of POPs to the environment from industrial processes					
No data to support unintentional production, not included in SC Article 5 list (release from unintentional POPs) . ¹⁰⁹					

¹⁰⁷ Climate Policy Watcher (2022), Metalworking Fluid Treatment and Recovery.

¹⁰⁸ UNEP, 2019. General technical guidelines on the environmentally sound management of wastes consisting of, containing or contaminated with persistent organic pollutants (UNEP/CHW.14/7/Add.1/Rev.1)

¹⁰⁹ The Stockholm Convention lists 5 POPs as applicable to Article 5 (Measure to reduce or eliminate releases from unintentional POPs). Of the POPs included in this study, only PCB is listed. Likewise, the UNEP Toolkit for Identification and Quantification of Releases of Dioxins, Furans and Other Unintentional POPs (2013) makes no mention of SCCP.

Annex 1: Substances listed under the Aarhus Protocol (1998) and the Stockholm Convention (2001) (as amended)

POPs	Stockholm Convention	Aarhus Protocol
Aldrin	✓	✓
Chlordane	✓	✓
Chlordecone	✓	✓
DDT	✓	✓
Decabromodiphenyl ether	✓	
Dicofol	✓	
Dieldrin	✓	✓
Technical Endosulfan and its related isomers	✓	
Endrin	✓	✓
Heptachlor	✓	✓
Hexabromobiphenyl	✓	✓
Hexabromdiphenylether and Heptabromdiphenylether	✓	✓
Hexabromocyclododecane	✓	
Hexachlorobenzene	✓	✓
Hexachlorobutadiene	✓	✓
Alpha hexachlorocyclohexane	✓	
Beta hexachlorocyclohexane	✓	
Lindane	✓	✓
Mirex	✓	✓
Pentachlorobenzene	✓	✓
Pentachlorophenol and its salts and esters	✓	
Pefluorohexane sulfonic acid (PFHxS), its salts and PFHxS-related compounds	✓	
Perfluorooctane sulfonic acid (PFOS), its salts and PFOSF	✓	✓
Perfluorooctanoic acid (PFOA), its salts and PFOA related compounds	✓	
Polychlorinated biphenyls (PCBs)	✓	✓
Polychlorinated dibenzo-p-dioxins (PCDD)	✓	✓
Polychlorinated naphthalenes	✓	✓
Polychlorinated dibenzofurans (PCDF)	✓	✓
Short-chain chlorinated paraffins	✓	✓
Tetrabromodiphenyl ether and pentabromodiphenyl ether	✓	✓
Toxaphene	✓	✓

Annex 2: Target POPs and SC Decisions

Category	SC Annex	Exemptions	Requirements under Annex	Elimination date (if applicable)	Relevant Decisions
Polychlorinated biphenyls (PCBs)	A (elimination) C (unintentional POPs)	Production: None Use: Articles in use in accordance with the provisions of Part II of Annex A, until 2025.	Elimination: <ul style="list-style-type: none"> • Make determined efforts to identify, label and remove from use equipment containing greater than 10 per cent polychlorinated biphenyls and volumes greater than 5 litres. • Make determined efforts to identify, label and remove from use equipment containing greater than 0.05 per cent polychlorinated biphenyls and volumes greater than 5 litres. • Endeavour to identify and remove from use equipment containing greater than 0.005 percent polychlorinated biphenyls and volumes greater than 0.05 litres Reduction: <ul style="list-style-type: none"> • Use only in intact and non-leaking equipment and only in areas where the risk from environmental release can be minimised and quickly remedied. • Not use in equipment in areas associated with the production or processing of food or feed. • When used in populated areas, including schools and hospitals, all reasonable measures to protect from electrical failure which could result in a fire, and regular inspection of equipment for leaks 	2025	SC-4/5 SC-4/8 SC-5/7 SC-6/6 SC-7/3 SC-8/3 SC-9/3
Hexabromocyclododecane (HBCD)	A (elimination)	Use: Expanded polystyrene (EPS) and extruded polystyrene (XPS) in buildings in accordance with the provisions of Part VII of Annex A Production: As allowed for the parties listed in the Register in accordance with the provisions of Part VII of Annex A. None of the eight target countries has registered an exception for this group of chemicals.	Eliminate: Prohibit and/or take the legal and administrative measures necessary to eliminate: (i) production and use of HBCD (ii) the import and export of HBCD	Banned. Specific exemptions have a limited timeframe and shall expire five (5) years after the date of entry into force of the Convention.	SC-6/13

Category	SC Annex	Exemptions	Requirements under Annex	Elimination date (if applicable)	Relevant Decisions
Short-chain chlorinated paraffins (SCCPs)	A (elimination)	<p>Production: As allowed for the Parties listed in the Register.</p> <p>Use:</p> <ul style="list-style-type: none"> Additives in the production of transmission belts in the natural and synthetic rubber industry. Spare parts of rubber conveyor belts in the mining and forestry industries. Leather industry, in particular fat liquoring in leather. Lubricant additives, in particular for engines of automobiles, electric generators and wind power facilities, and for drilling in oil and gas exploration, petroleum refinery to produce diesel oil. Tubes for outdoor decoration bulbs. Waterproofing and fire-retardant paints. Adhesives. Metal processing. Secondary plasticisers in flexible polyvinyl chloride, except in toys and children's products. <p>None of the eight target countries has registered an exception for this group of chemicals.</p>	<p>Eliminate:</p> <p>Prohibit and/or take the legal and administrative measures necessary to eliminate:</p> <p>(i) production and use of SCCPs (ii) the import and export of SCCPs</p>	<p>Banned.</p> <p>Specific exemptions have a limited timeframe and shall expire five (5) years after the date of entry into force of the Convention.</p>	SC-8/11
Perfluorooctane sulphonic acid (PFOS), its salts and perfluorooctane sulphonyl fluoride.	B (restriction)	<p>Production:</p> <p>Acceptable purpose: In accordance with Part III of this Annex, production of other chemicals to be used solely for the use below. Production for uses listed below. <u>Specific exemption:</u> None</p> <p>Use:</p> <p>Acceptable purpose:</p>	<p>The production and use of perfluorooctane sulfonic acid (PFOS), its salts and perfluorooctane sulfonyl fluoride (PFOSF) shall be eliminated by all Parties except as provided in Part I of this Annex for Parties that have notified the Secretariat of their intention to produce and/or use them for acceptable purposes.</p>	<p>By the end of 2022, if it has the capacity to do so, restrict uses of</p> <p>Fire-fighting foam that contains or may contain PFOS, its salts and PFOSF to sites where all releases can be contained;</p>	<p>SC-4/17 SC-4/19 SC-5/5 SC-6/4 SC-6/7 SC-7/1 SC-7/5 SC-8/5 SC-9/4</p>

Category	SC Annex	Exemptions	Requirements under Annex	Elimination date (if applicable)	Relevant Decisions
		<p>In accordance with Part III of this Annex for the following acceptable purpose, or as an intermediate in the production of chemicals with the following acceptable purpose:</p> <ul style="list-style-type: none"> • Insect baits with sulfluramid (CAS No. 4151-50-2) as an active ingredient for control of leaf-cutting ants from <i>Atta</i> spp. and <i>Acromyrmex</i> spp. for agricultural use only. <p><u>Specific exemption:</u></p> <ul style="list-style-type: none"> • Metal plating (hard-metal plating) only in closed-loop systems • Fire-fighting foam for liquid fuel vapour suppression and liquid fuel fires (Class B fires) in installed systems, including both mobile and fixed systems, in accordance with paragraph 10 of part III of this Annex. <p>None of the eight target countries has registered an exception for this group of chemicals.</p>			SC-9/5
